# Employee Record Management System

Lalitha Prasad

Employee record management system manages records of the employees in a company. Three operations can be performed, namely, add a record, delete a record, and modify a record. The details of the employees stored are id (int), name (string), age (int), educational qualification (string), and role (string).

- When an employee joins the company his details are recorded in the system.

- When he leaves the company his record is deleted.

- When an employee gets promotion or improves his qualification, his record is updated with the new details.

An 'admin' user with proper login credentials is allowed to perform the above operations. Only one 'admin' is allowed to exist in the system.
